## 1.1

### Design features

#### General information

The scope of this catalog is to present our range of motor bell housings designed to fit Rossi G series helical and bevel helical gearboxes with motors.

The production planning includes the connection of electric motors with gear reducers by means of flexible coupling.

Connection available for:

- IEC standard electric motors, mounting position IM B5, from size 132 to size 315.
- NEMA standard electric motors, TC flange, from size N180TC to size N440TC

Connection available for gear reducers, helical and bevel helical type, from size 125 to size 360.

#### Available executions:

##### Helical gearboxes:

2I - 3I / UP2A std

2I - 3I / UP2D Consult us

##### Bevel helical gearboxes:

CI - C2I / UO2A std

CI - C2I / UO2V std

CI - C2I / UO2H std with BH fitted on extension 1

CI - C2I / UO2H std with BH fitted on extension 2

CI / UO2D std with BH fitted on extension 2

**BH bell housing not available** for following non-standard designs:

- Independent cooling fan (except double extension high speed shaft)
- ATEX design
- Labyrinth seals on high input shaft

**When selecting a gearbox with bell housing it is recommended to verify the service factor of the selected drives on the basis of motor power and motor speed and in accordance with gearbox nominal performances stated on G catalog.**

**To assure the proper reliability to the gearbox, according to the application, please consult instructions stated on Rossi G cat. Cap. 3 - Service factor.**

#### Housing

Housings are designed to deliver optimal strength and stiffness performance. They are equipped as standard with inspection windows to ensure high reliability.

They are made of nodular cast iron suitable for a range of temperature between -20°C and +50°C . It is also possible to supply solutions for environment conditions that exceed these values. In case please contact us.

#### Coupling

Flexible couplings are the standard solution provided.

Design temperature: -30°C / +50°C . We can also provide various types of couplings (geared, flexible all-steel, etc.) for applications with environmental conditions exceeding the aforementioned temperature limits, as well as for ATEX environments. Please contact us for more information.

#### BH 65×550

MOTOR FRAME	
(Ød × ØP) N180 ... N440 TC	IEC frame size 132 ... 315 NEMA frame size; TC = T shaft C flange
BELL HOUSING	

#### Housing

Thoroughly clean and degrease all mating surfaces. Screws class 8.8 or 10.9, where indicated, must be used to fit bell housing to the gearbox.

Use 10.9 screws tightened to the torque values specified for 8.8 screws. A torque wrench must be used. Do not apply lubricants that could alter the friction coefficient, as this may lead to overloading the screws. Always check the tightening torque after the first few hours of operation. Motor connection bolts are always included.

#### Coupling

It is crucial to ensure that the initial axial and radial alignment is as precise as possible. This will help accommodate changes in operating conditions and ensure the coupling's long-term reliability and trouble-free performance.

Assembly of "Half-coupling" motor side (in case of motor assembling not realized by Rossi) :

- Remove the rubber components.
- Connect the hub to the motor shaft using the spacer provided, placing it between the motor shaft shoulder and the coupling hub.

It is recommended to heat the hub (up to a maximum of 80°C) during assembly to facilitate installation.

- Re-assemble the rubber components.

To ensure reliable coupling performance, it is recommended to use electric motors with mating tolerances that meet the accuracy standards specified in IEC 60072-1.

For the assembly of non-standard couplings, feasibility must be verified. In such cases, please refer to the specific supplier documentation.

## 1.4

### Verifications

#### Maximum bending torque

Verify that the static bending torque ( $M_b$ ) generated by the motor weight on the counter flange of the gear reducer is lower than the maximum allowable value ( $M_{bmax}$ ) specified in the following pages:

$$M_b < M_{bmax}$$

where:

$$M_b = G \cdot (X + E) / 1\,000 \text{ [N m]}$$

G [N] motor weight; numerically nearly equal to motor mass, expressed in kg, multiplied by 10

X [mm] distance from motor center of gravity to motor flange surface

E [mm] supplied in the following pages, according to gear reducer and motor size

Very long and thin motors, even if their bending torques are within the prescribed limits, may generate abnormal vibrations during operation. In such cases, it is necessary to provide additional motor support as outlined in the motor's specific documentation.

Higher-than-permissible loads may occur in dynamic applications where the gearmotor is subjected to translation, rotation, or oscillation (e.g., shaft mounting arrangements). Please consult us for a detailed analysis of each specific case.

1) Valid for motor 447/9TC - Possible combination upon usable key length verification at shear and specific pressure.

2) Max bending torque page 8.

For available executions see page 6.

Notes of page 16:

\*) Working length of thread 15 · S.

1) Possible combination upon usable key length verification at shear and specific pressure.

2) Max bending torque see page 8.

3) For available executions see page 6.

Notes of page 17:

1) Possible combination upon usable key length verification at shear and specific pressure.

2) Verification valid for motor 447/9TC.

3) Max bending torque see page 8.

4) For available executions see page 6.

\*) Working length of thread 1.5 S.

1) Possible combination upon usable key length verification at shear and specific pressure.

2) Max bending torque see page 8.

3) For available executions see page 6.

## R C2I motor bell housing for NEMA standard motors, T shaft, C flange

1) Possible combination upon usable key length verification at shear and specific pressure.

2) Verification valid for motor 447/9TC.

3) Max bending torque page 8.

4) For available executions see page 6.
